

Assignment No. 11

Experiment Title: Database Connectivity

Problem Statement:

Download any dataset from SQL and perform data modeling and create a basic dashboard using Tableau and PowerBI.

Theory:

Database connectivity and loading data from database.

The screenshot displays two applications side-by-side. The top application is Microsoft SQL Server Enterprise Manager, showing a SQL query window with the following code:

```
-- Insert rows into table 'Customers'
INSERT INTO dbo.Customers
([CustomerId],[Name],[Location],[Email])
VALUES
( 1, N'Orlando', N'Australia', N'' ),
( 2, N'Keith', N'India', N'keith@adventure-works.com' ),
( 3, N'Donna', N'Germany', N'donna@adventure-works.com' ),
( 4, N'Janet', N'United States', N'janet1@adventure-works.com' )
GO

-- Select rows from table 'Customers'
SELECT * FROM dbo.Customers
```

The bottom application is Power BI Desktop, showing a table visualization of the query results. The table has the following data:

CustomerId	Name	Location	Email
1	Orlando	Australia	
2	Keith	India	keith@adventure-works.com
3	Donna	Germany	donna@adventure-works.com
4	Janet	United States	janet1@adventure-works.com

The Power BI Desktop interface also shows the 'Visualizations' pane with a table visualization selected, and the 'Data' pane showing the 'Customers' table with fields CustomerId, Email, Location, and Name.

Conclusion: In conclusion, using Tableau and Power BI with SQL datasets streamlines data modeling and dashboard creation. Direct connections to SQL databases enable seamless preprocessing, modeling, and visualization, facilitating efficient analysis and decision-making. This integration enhances organizational effectiveness by providing actionable insights and fostering clear communication of findings.
